Live Co2 Innovation Programme

What challenge or problem are you addressing? What is the need for the project?

1. Carbon Emissions Co2/Kwh from Data integrity with live Carbon processing to form a new energy recode, matrix
2. Demand main revenue UK Housing Sector have already invested, this is more than an idea/concept
3. The NEED balances the Corporate Sustainable Asset governance to the DEMAND netting the cash exchange and clean technology processing
4. Ability for global trading of Carbon between Energy providers and government obligations to their carbon reduction commitments and targets
5. Ensuring the value of asset to emissions ratio is fairly shared back to communities to focus on processing and procuring clean measures

Objective of the project: What your project wants to achieve/change

The ability to live read carbon emissions pre and post savings to enable a clear picture of “lifecycle” modelling for the cyclical model of Einstein’s Theory, bringing transparency to Corporates need to adhere to climate agreement; with an immediate project focus of sustaining a gap within the UK governance to Carbon emissions savings

Why do you need transnational cooperation?

A legal draft deed defines “Any Territory leasing of licenses for the purpose of air quality, noting there are no boarders to the abatement of carbon emissions within our oxygen content “

What kind or partners are you looking for?

Ethical clean parties that are willing to adopt internal and external intellectual processing to net an ongoing approach to Neutralize emission globally, this can be across any sector that holds property portfolios i.e. “land assets” including “automobile and logistical frequencies”
