CO2Go

Connecting community's to the benefit of consumption reduction and Renewable Energy generation

What challenge or problem are you addressing? What is the need for the project?

NWE communities are fragmented and many struggle economically, environmentally and/or socially with many in severe disadvantage. With skilled facilitation energy saving/generation or waste recycling interventions can lead to significant benefits economically, environmentally and socially. There is no independent method or platform that connects NWE communities to the above benefits. A relatively small number of communities continue to save/generate energy and/or reduce their waste footprints but they cannot independently trade the value they offer as larger companies are mandated to do.

Objective of the project: What your project wants to achieve/change

To trade the energy saved/generated by communities on an independent trading platform. To explore whether this platform could also trade the energy saved through waste reduction interventions. Empowering communities.

Why do you need transnational cooperation?

To connect and complement the practice and experience in Ireland where communities have sold energy saved/generated to an umbrella organization in Europe who represent community-based RE projects to an umbrella organization in Belgium representing community-based waste recycling projects. To connect practice, experience and know how across NWE boundaries.

What kind or partners are you looking for?

Interested, synergetic organisations with a track record of accomplishment in this area.

Your contact details

Name	Vincent Carragher
Organisation	Civil and Structural and Environmental Engineering, Trinity College Dublin
Region	Dublin
Country	Ireland
Telephone number	089 4162180
