Energie+

Energy efficiency decision-making tool

23

What challenge or problem are you addressing? What is the need for the project?

The success of Energie+ in the French-speaking community indicates that there is a need for neutral and scientific, yet vulgarized, information on building physics.

Our NWE Interreg project aims at mutual benefit for Energie+ current and future partners:

- New partners will benefit from Energie+ experience, infrastructure and existing content to develop local versions: it is much more efficient to build from robust existing tools than develop new ones from scratch.
- Current partners will benefit from international experience to improve Energie+ structure and content through peer reviewing and perspective shifting.

Objective of the project:

The final beneficiaries are local building communities, managers, designers and contractors who will benefit from high quality neutral information to improve theirs practices and reduce energy consumption.

Why do you need transnational cooperation?

North West Europe is the ideal scale to broaden Energie+ audience since climatic conditions and construction practices shows similarities in this area.

What kind or partners are you looking for?

To develop an international version of Energie+, we are looking for partners (academic or non-profit organization) willing to get involved in one or several of the following tasks in any NWE area:

- Translate the Energie+ chapters relevant for their local context in English and/or local languages;
- Contribute to the update of theses chapters through a wiki-like process involving all partners, in a neutral and evidence-based perspective.
