INSY

Industrial synergie to decrease GHG emissions

26

What challenge or problem are you addressing? What is the need for the project?

We have the technology to go to the moon and back… but we rarely succeed to cooperate to reduce the CO^2 emission. The large industry region at the sea canal is the economical hot spot of the region, with a lot of potential to decrease GHG emissions. Different companies would like to go to a large energy project, but they need a facilitator. The project is the neutral actor, key and bridge function that connects the companies.

Objective of the project:

The project results would be:

- a significant reduction of GHG emissions (at the end and more in the years following)
- an agreement between companies and time schedule for the hole heating network

Why do you need transnational cooperation?

North West Europe has multiple large industrial areas with a high GHG emission saving potential. I need examples, experience, pilots and knowledge in facilitating the uptake in low carbon technologies by industrial synergies.

What kind or partners are you looking for?

Partners who have experience/knowledge with, are going to introduce:

- a heating network between different companies
- a synergy between large companies
- making a trans-border exchange of heat

(universities, companies, public organisations, …)
