#### **Mapping methods**

- They can provide a wide spatial coverage
- Relatively easy to deploy and acquire data

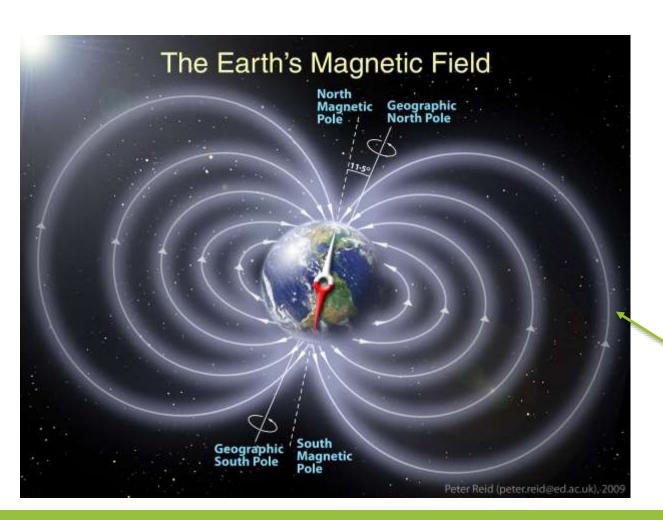

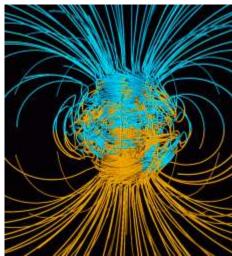

## Introduction to Magnetometry

#### **Basic principle**

Glatzmaier-Roberts geodynamo model

Schematic representation of the invisible magnetic field lines

#### For example, in Liege (Belgium)

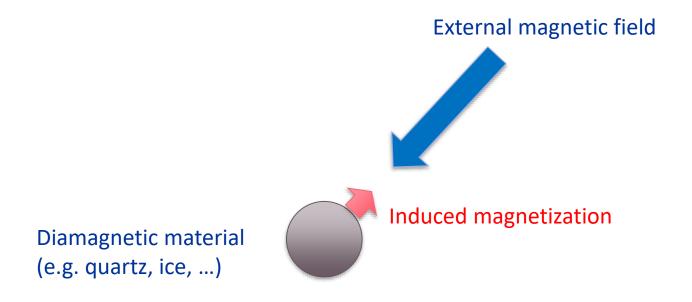

| Magnetic Field |                              |                              |                         |                         |                          |                             |             |  |  |  |  |  |

<sup>\*</sup>National Centers for Environmental Information –National Oceanic and Atmospheric Administration (NOAA)

The magnetometry method aims to find disturbances in the Earth's magnetic field

#### **Magnetic disturbances?**

Weak, negative magnetic susceptibility of around  $-10^{-6}$  à  $-10^{-5}$  SI

#### **Magnetic disturbances?**

#### External magnetic field

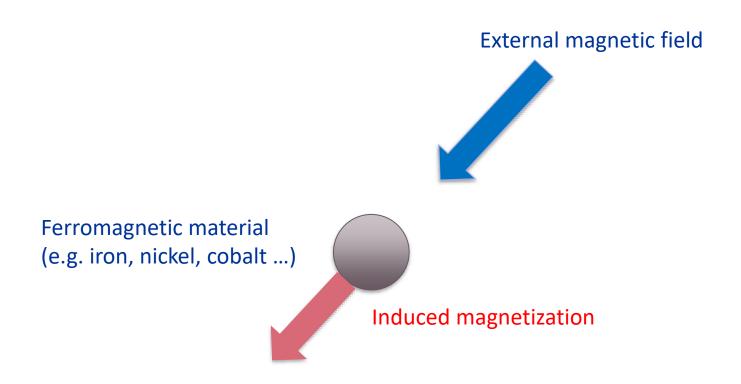

Material paramagnetic (e.g. aluminium, sodium, lithium...)

Induced magnetization

Weak, positive magnetic susceptibility of around 10<sup>-5</sup> à 10<sup>-3</sup> SI

#### Magnetic disturbances?

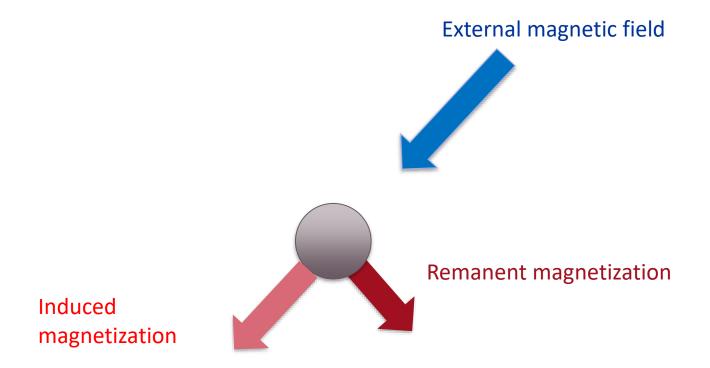

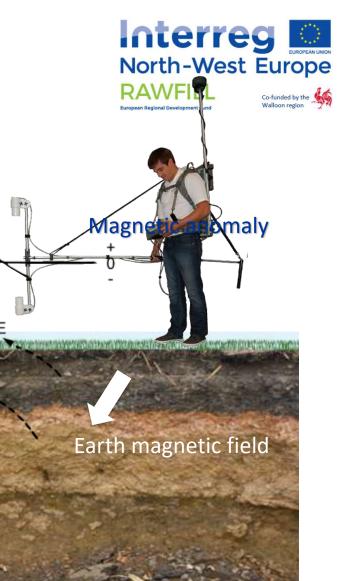

Large magnetic susceptibility of around 50 à 10<sup>4</sup> SI

#### Magnetic disturbances ?

#### **Data acquisition**

RAWFILL 11

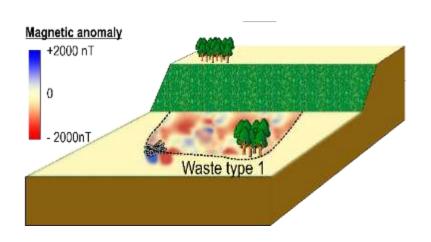

RAWFILL 12

#### **Targeted property**

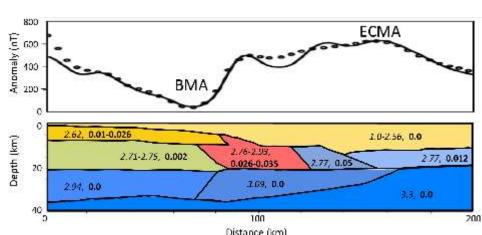

#### **Qualitative**

Display the magnetic field values, the magnetic gradient or total field magnetic anomaly

#### **Quantitative**

Model and/or invert the data to estimate magnetic susceptibility

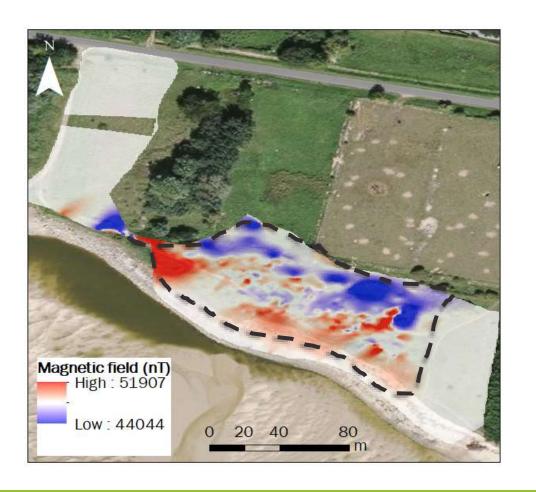

Magnetic susceptibilty model. Duff & Kellogg, 2019.

Magnetic susceptibility of MSW → 0.06-0.12 SI (Vollprecht et al., 2019; Appiah et al., 2018)

#### **Lingreville landfill**

Waste lateral extension

#### **Pros and cons**

#### **Advantages**

- Relatively easy to deploy in the field
- Rapid spatial coverage
- Can detect magnetic objects (e.g. drums)
- Can detect landfill boundaries

#### **Limitations**

- Infrastructure of the site (e.g. fences, excavators, utilities) can interfere with the measurements
- Quantitative interpretation not trivial

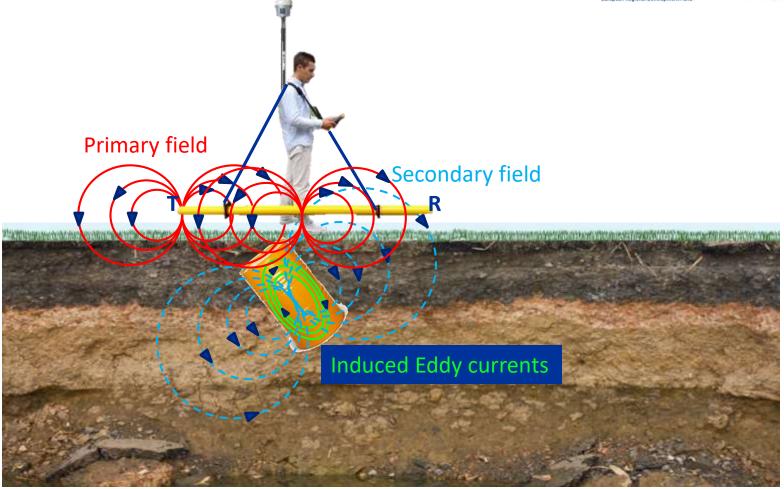

# Introduction to Electromagnetic induction (EMI)

Frequency-domain

**ULiege & BGS** 

#### **Principles and acquisition**

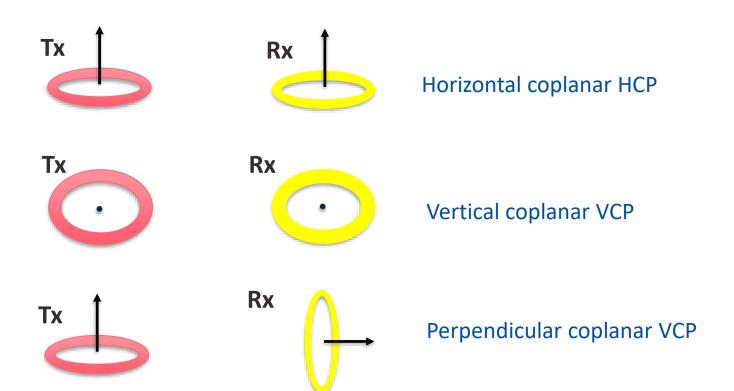

RAWFILL 1

#### **Coil configuration**

#### **Depth of investigation (DOI)**

Skin depth

$$\delta = \sqrt{\frac{2}{\mu_0 \omega \sigma}}$$

Depth of penetration dependent on:

- Frequency of transmitted electromagnetic wave
- conductivity of the subsurface

For a separation **s** between **Tx** and **Rx**, the induction number

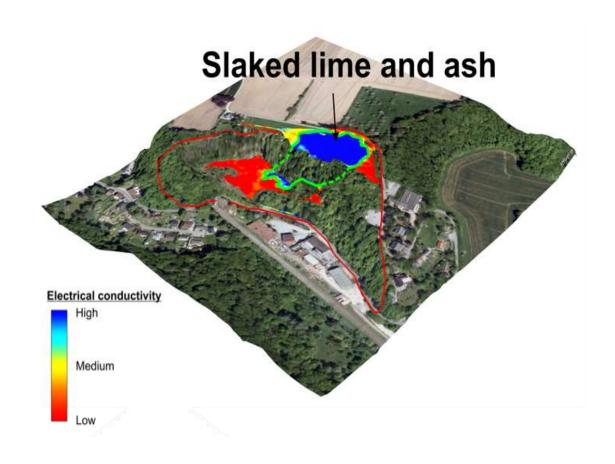

$$\beta = \sqrt{\frac{s}{\delta}} \ll 1$$

As a rule of thumb:

- DOI ~ 1.5s HCP
- DOI ~ 0.75s VCP
- DOI ~ 0.5s PRP

#### **Onoz landfill**

#### Pros and cons

#### **Advantages**

- Rapid spatial coverage
- Can detect areas of increased leachate content and/or metallic scrap content
- Can detect landfill boundaries, geometry and structure (layering) of a landfill
- Multiple receiver coils can be used simultaneously

#### **Limitations**

- Infrastructure of the site (e.g. fences, excavators, utilities) can interfere with the measurements
- High electrical conductivity limits
  depth of investigation which may be
  problematic in landfills as organic
  waste, metal scraps or leachate have
  large values of electrical conductivity

### Thank you!

## Raw materials recovered from landfills

The Interreg North-West Europe Project is coordinated by SPAQuE and unites 8 partners from 4 EU regions.
