Eurofins ADME Bioanalyses

Neuroscience biomarkers in diagnostic & drug development

Codex4SMEs – 6th of July 2021

Isabelle Molina
Biomarker Unit Manager
IsabelleMolina@eurofins.com

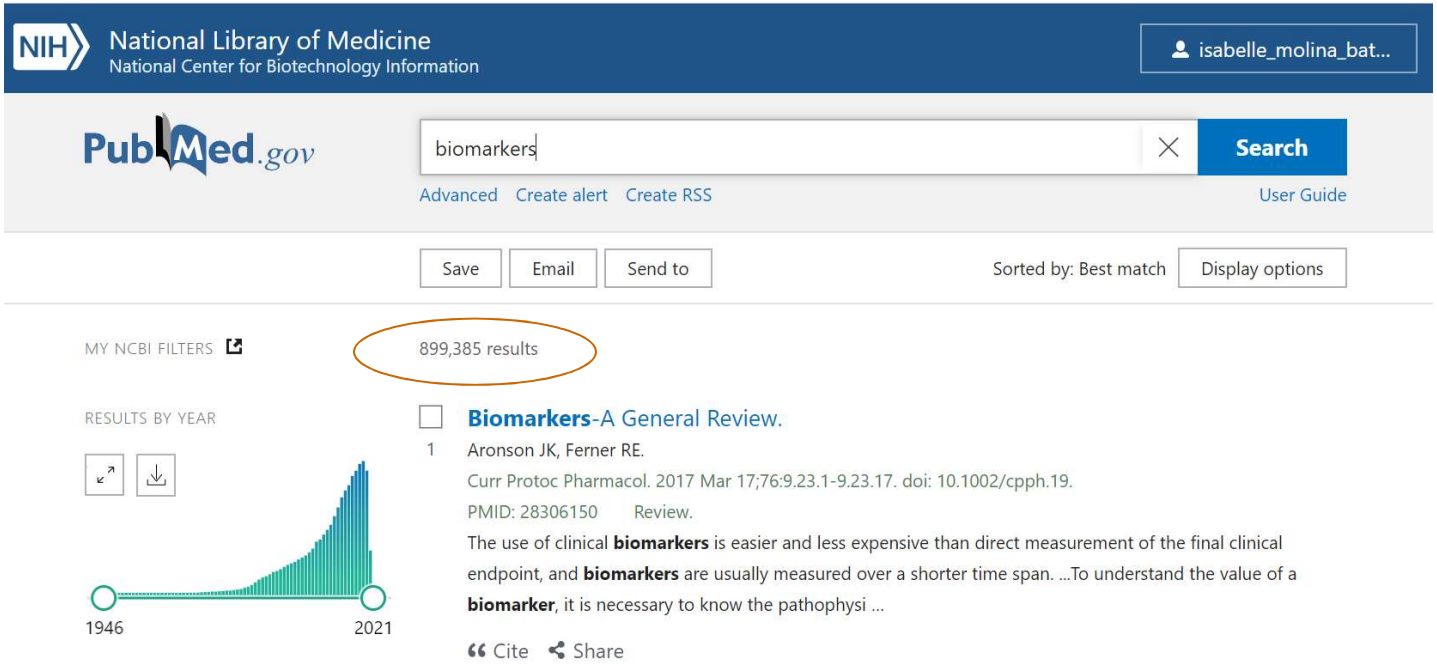
Biomarkers – Definition (NIH)

eurofins | ADME BIOANALYSES

Supporting DMPK from screening to registration

A biomarker is “a characteristic that is objectively measured and evaluated as an indicator of normal biological processes, pathogenic processes, or pharmacologic responses to a therapeutic intervention.”

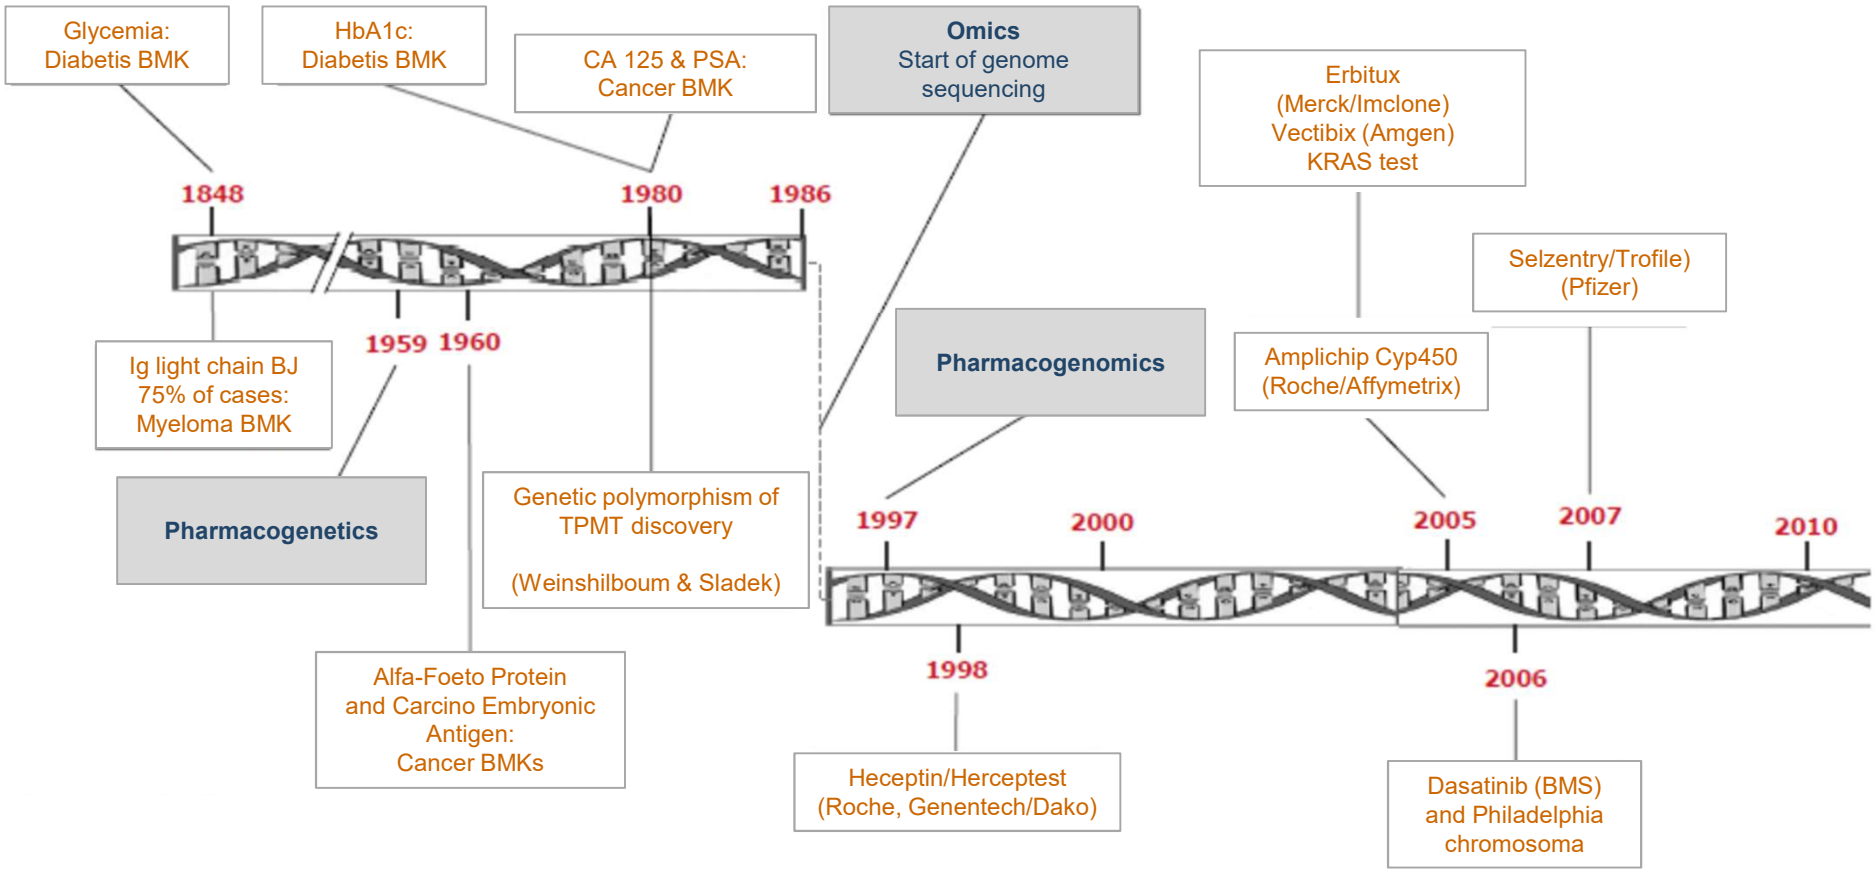
They inform about natural history of a disease or drug activity. They can be used as metrics.



Biomarkers - History

eurofins | ADME BIOANALYSES

Supporting DMPK from screening to registration



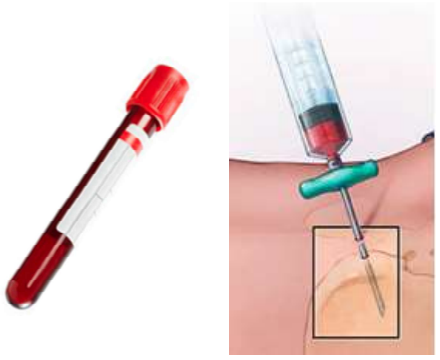
Ig: Immunoglobulin
BJ: Bence-Jones proteins
PSA: prostate specific antigen
TPMT: thiopurine-methyltransferase

Adapted from: BMS : Bristol-Myers Squibb

Biomarkers - Types

- Invasive biomarkers

proteins, genes (DNA, RNA), carbohydrates, metabolites, enzymatic activity: *tissue biopsies & biofluids*
e.g. creatinine for kidney function, LDL cholesterol for cardio diseases, PSA for prostate cancer…



Credit: https://www.tymora-analytical.com/

- Non-Invasive Biomarkers

ultrasound, elastometry: *physical technologies*
MRI, PET, echography: *imagery*

Credit: https://www.echosens.com/products/fibroscan-expert//

An imaging biomarker is a biological characteristic that is detectable on an image (analytical or qualitative).
e.g. blood pressure to check on heart diseases and cardiovascular risk, FibroScan® (kPa) for liver fibrosis, liver steatosis and portal hypertension assessment.

Biomarkers diversity & Biofluids

eurofins | ADME BIOANALYSES

Supporting DMPK from screening to registration

Human genome

≈ 35 000 genes

↓

300 000 mRNA
(alternative splicing)

↓

over 1 million functional proteins
(post translational modifications)

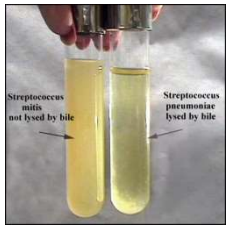
Human proteomes

urine
≈2500 proteins
sysdiag.cnrs.fr/DUP/

plasma
serum
≈3000 proteins
HUPO PPP Omenn, 2007

CSF
≈2600 proteins
Schutzer, Plos One 2010

tears
≈1500 proteins
Zhou.L, J of Proteomics, 2012

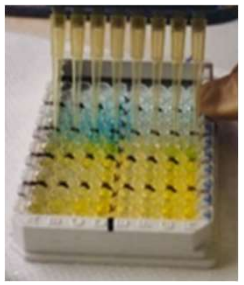


Saliva
≈1100 proteins
Denny, JPR, 2008
30% of plasma/tears proteins

Biomarkers – Assay types

eurofins | ADME BIOANALYSES

Supporting DMPK from screening to registration



- Quantitative or semi-quantitative assays

Method of analysis whose response is the amount of analyte measured either directly (counting in a mass or volume), or indirectly (color absorbance, impedance, etc.) in a certain amount of sample.

Quantitative: biochemistry, hormonology , blood counts…

Semi-quantitative : OD with a threshold effect (EIA or RIA) - Serology

- Qualitative assays

Method of analysis whose response is qualitative (presence/absence of the analyte) and measured either directly or indirectly (color absorbance, impedance, etc.) in a certain amount of sample

Immuno-chromatography (Western-Blot, lateral-flow, etc.), latex Agglutination, Immuno-electrophoresis,

Immunofluorescence (auto-antibody, serology, bacteria screening…)

Biomarkers
Dx & Drug development

eurofins | ADME BIOANALYSES

Supporting DMPK from screening to registration

Two major types of BMK with different rules of validation and registration – IVD

- Medical Device: BMK used independently to a specific drug, such as diagnostic or monitoring assays

Diagnostic / Early detection:

Disease vs. Healthy, Gene test for monogenic diseases (like cystic fibrosis), PSA (prostate cancer), cardiac markers…

Monitoring:

HbA1c (diabetes), Immune markers (after transplantation), titer (after vaccination)

Registration : Europe « Directive 98/79/CE DMDIV » – US « FDA 21CFR 820 »

- Companion BM

BMK used once before treatment to predict patients response to treatment

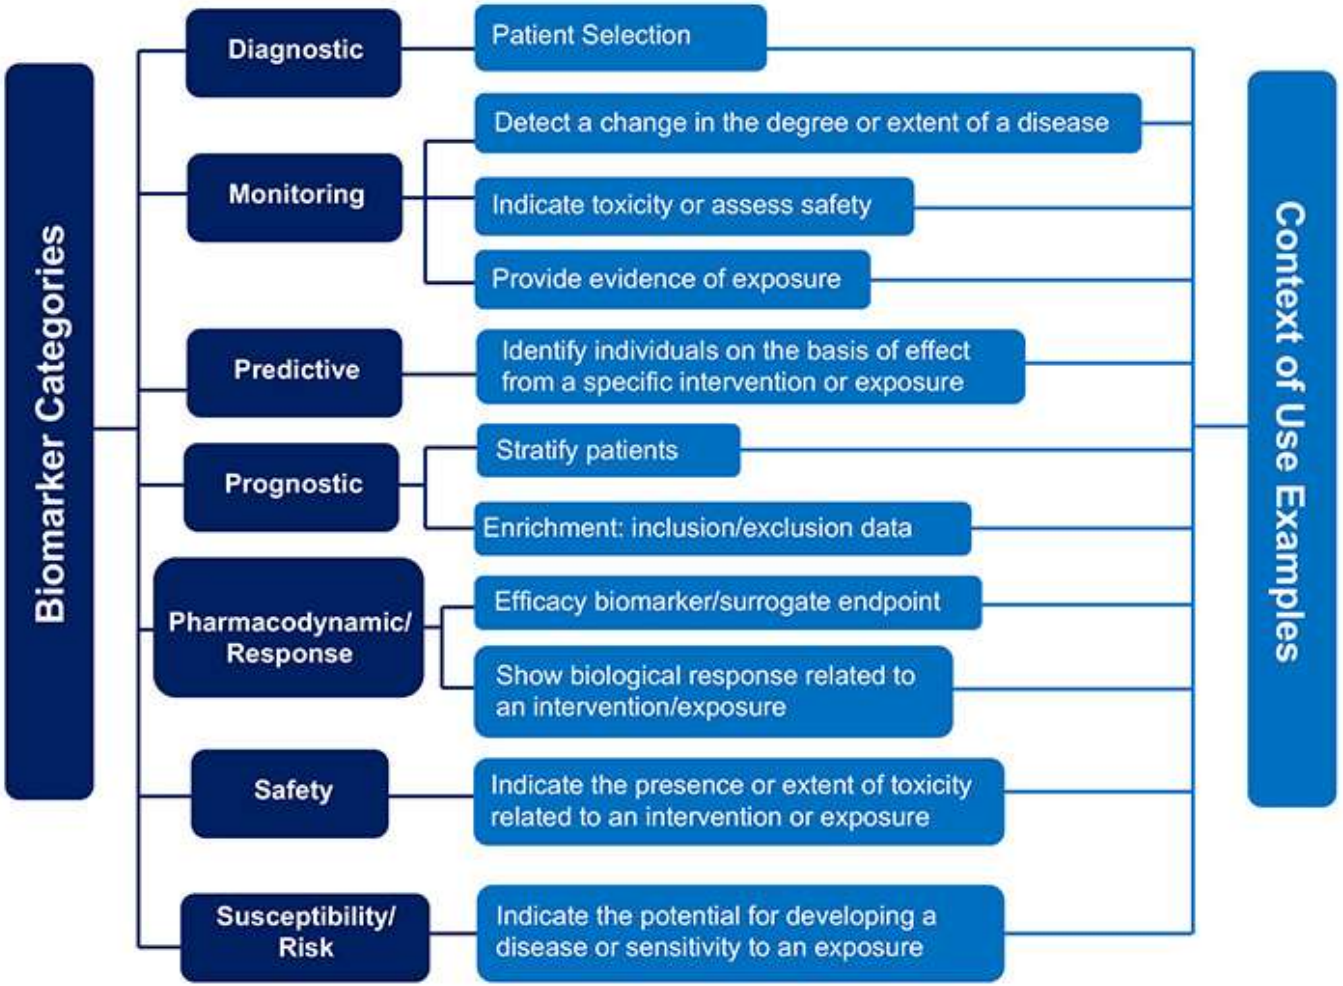
BMK used with drug development: safety BMK, efficacy BMK, dose selection

Registration : recommendations from EMA « Draft guideline on key aspects for the use of pharmacogenomic methodologies in the pharmacovigilance evaluation of medicinal products», January 2014 and FDA « FDA guidance In vitro companion diagnostic devices » August, 2014.

Biomarkers – Context Of Use

eurofins | ADME BIOANALYSES

Supporting DMPK from screening to registration



COU drives everything !

https://www.fda.gov/drugs/biomarker-qualification-program/context-use

Diagnostic

eurofins | ADME BIOANALYSES

Supporting DMPK from screening to registration

- Five major phases and decision gates (or Milestone) in the Biomarker development process: 3 – 4y (optimal timelines)

*Customer needs definition
*Mkg Product design
*Time line
*Resources
*Business Plan
6-9 months

*Product Design specification
*Formulation
*Design freeze
*Analytical & clinical validations
9-12 months

*Product optimization vs industrial and economic constraints
*R&D batches validation
6-9 months

*Transfer to manufacturing
*Production of Pilot batches
*Performance validation
6-9 months

*Customer needs definition
*Time line
*Resources-
*Business Plan

$$Se = \frac{TP}{FN + TP}$$

- Diagnostic sensitivity

Ability of an IVD examination procedure to identify the presence of a target marker associated with a particular disease or condition

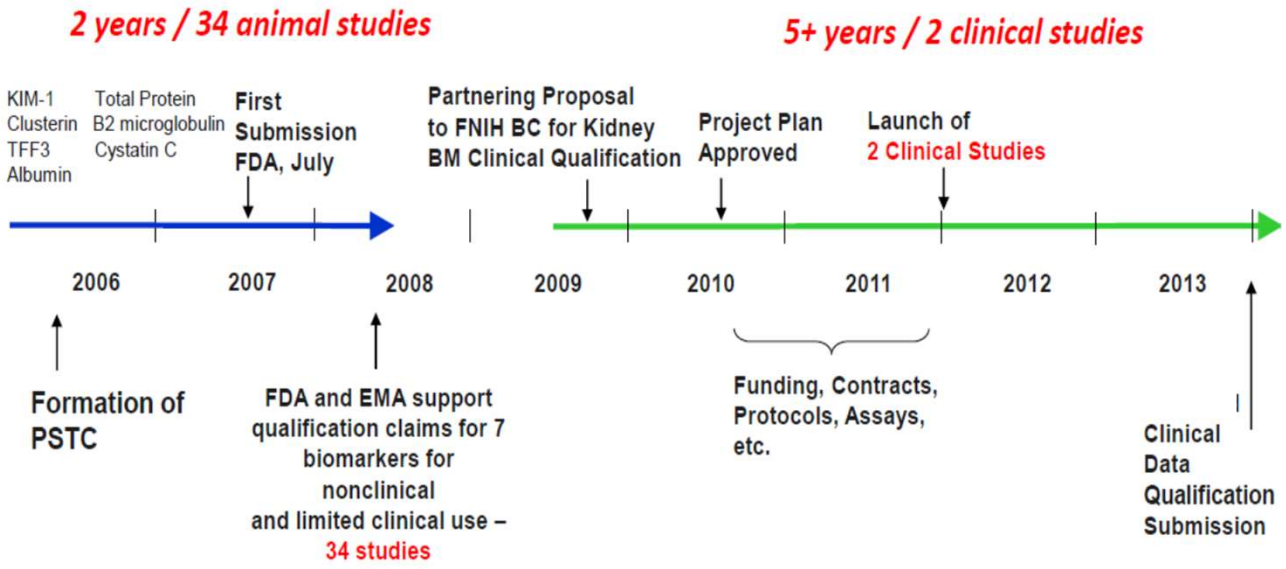
A test with 100% sensitivity correctly identifies all patients with the disease. A test with 80% sensitivity detects 80% of patients with the disease (true positives) but 20% with the disease go undetected (false negatives).

Drug development

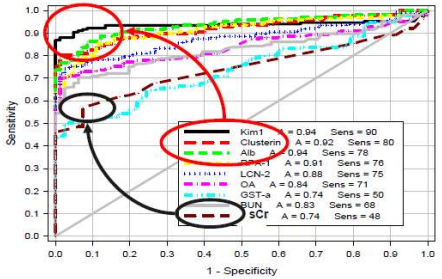
eurofins | ADME BIOANALYSES

Supporting DMPK from screening to registration

Predictive safety testing consortium: Kidney Safety Biomarkers Qualification 7+ y timelines



- Example: New kidney safety biomarkers can outperform serum creatinine and BUN
  - FDA, EMA, PMDA Qualification

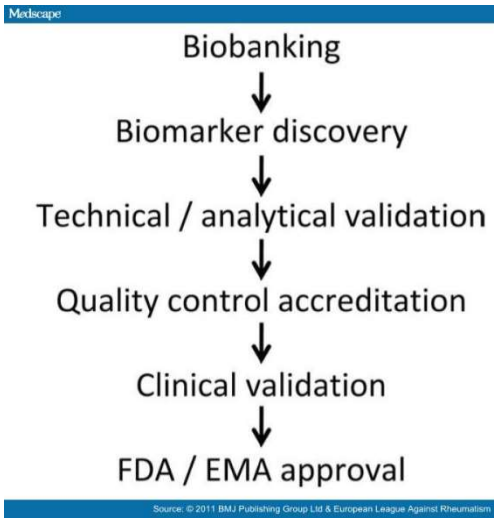


- Enable continued clinical development of drugs suspected of human irrelevant animal toxicities
- Ensuring patient safety
- Reducing drug failures and loss of time

BMK process

eurofins | ADME BIOANALYSES

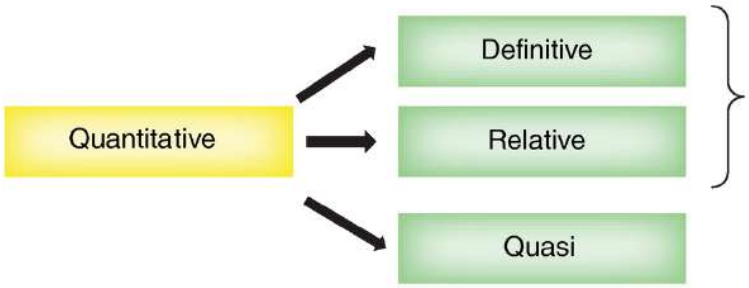
Supporting DMPK from screening to registration



- **Biobanking:**
  - Define and establish validation cohorts with biosamples (well characterized, proper collection & storage temperature…) => can be decisive for success or failure
  - Retrospective cohort (adapt number sample/statistic analysis)
- **BM discovery : Design input**
  - Technologies used (proteomic, genomic, transcriptomic…)
  - Robustness of the data (nb of sample : diseased vs healthy group, sample preparation, statistic analysis…)
  - Utility vs existing BM (market analysis, profitability, business plan…)
  - Intended use => Product Design Requirement
- **Validations :**
  - **Writing a Product Design specification**
  - **Analytical validation: Define the reliability and robustness of the test**
    - ✓ Precision, Stability, robustness studies
  - **Clinical validation: Define performance and relevance of the test in the given application**
    - ✓ Clinical sensitivity, specificity
- **Clinical utility / Clinical evidence:**
  - Demonstration of the potential usefulness
  - Added value to patient management decision-making

EBF

Biomarker assays are not PK assays



Biomarker levels determined using a reference standard

Reference material is representative of test samples (parallelism)

Reference material not available or not representative of test samples (non-parallelism)

Biomarker levels expressed in terms of a characteristic of the test sample (e.g. assay signal, titre, % bound)

Qualitative

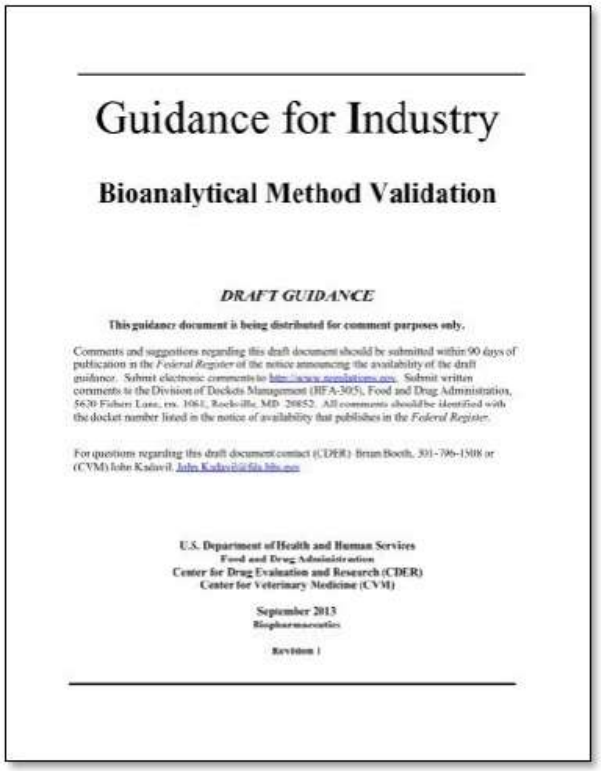
Biomarker levels expressed in nominal (positive or negative) or ordinal terms (e.g. 1 to 5 scoring scale)

Bioanalysis (2020) 12(20), 1427–1437

COU for biomarkers is not the same as for PK assays
May change depending on data and decisions being made

EBF

Things started to look different …..



Guidance for Industry

Bioanalytical Method Validation

DRAFT GUIDANCE

This guidance document is being distributed for comment purposes only.

Comments and suggestions regarding this draft document should be submitted within 90 days of publication in the *Federal Register* of the notice announcing the availability of the draft guidance. Submit electronic comments to http://www.regulations.gov. Submit written comments to the Division of Dockets Management (HFA-305), Food and Drug Administration, 5630 Fishers Lane, rm. 1061, Rockville, MD 20852. All comments should be identified with the docket number listed in the notice of availability that publishes in the *Federal Register*.

For questions regarding this draft document contact (CDER) Brian Booth, 301-796-1308 or (CVM) John Kadavil, John.Kadavil@fda.hhs.gov.

U.S. Department of Health and Human Services

Center for Veterinary Medicine (CVM)

September 2013
Biopharmaceutics

Revision 1

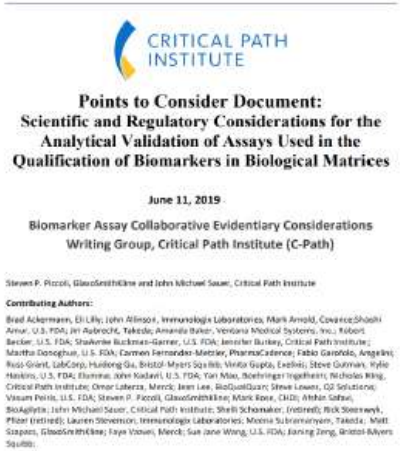
Selective, sensitive, and validated analytical methods for the quantitative evaluation of drugs and their metabolites (analytes) and biomarkers are critical for the successful conduct of nonclinical and/or biopharmaceutics and clinical pharmacology studies. Validating bioanalytical methods includes performing all of the procedures that demonstrate that a particular method used for quantitative measurement of analytes in a given biological matrix (e.g., blood, plasma, serum, or urine) is reliable and reproducible for the intended use. Fundamental parameters for this validation include the following:

- Accuracy
- Precision
- Selectivity
- Sensitivity
- Reproducibility
- Stability

EBF

So do we need guidance?

- Regulatory guidance cannot cover all eventualities for biomarkers within pharmaceutical development
- Existence of white papers for things to consider
- Regulation will only serve to remove the act of thinking and create “tick box” mentality
- What is needed is scientific and “**biomarker thinking**”
- Following guidance doesn’t automatically make an assay the right assay for the intended purpose to get the right data



CRITICAL PATH INSTITUTE

Points to Consider Document: Scientific and Regulatory Considerations for the Analytical Validation of Assays Used in the Qualification of Biomarkers in Biological Matrices

June 11, 2019

Bioanalysis

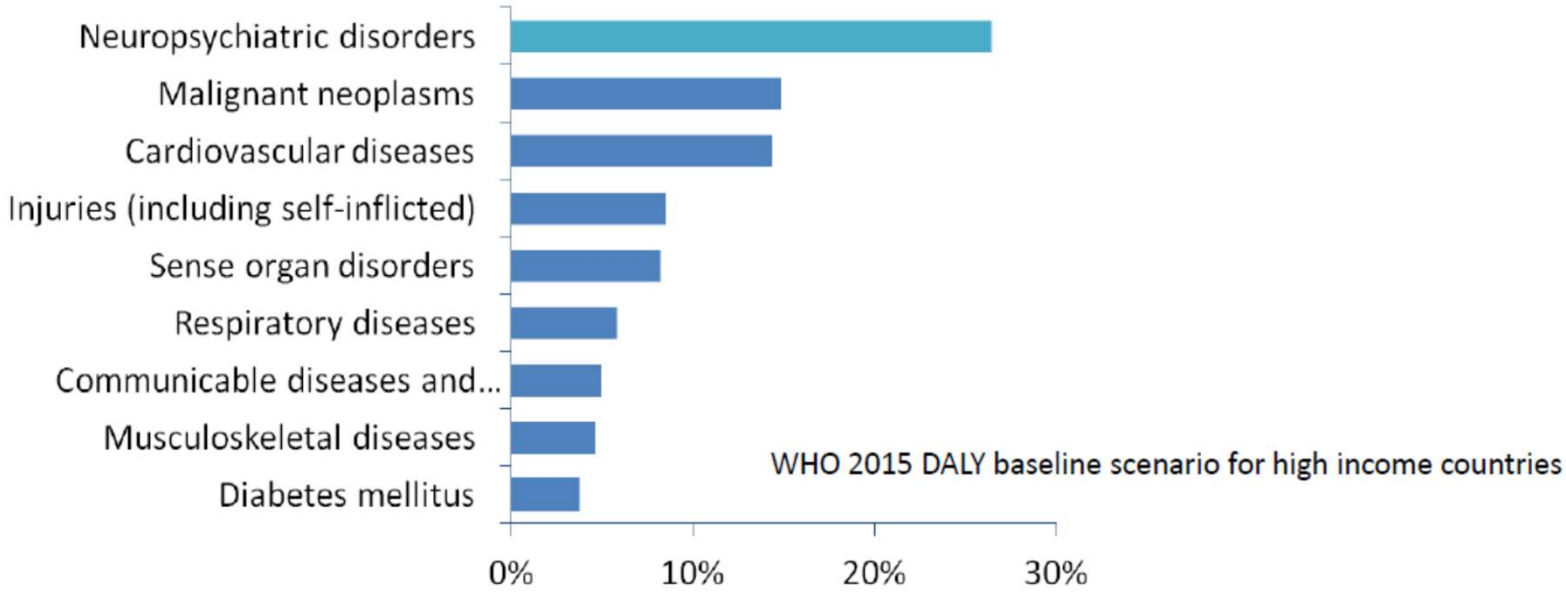
Update to the European Bioanalysis Forum recommendation on biomarkers assays; bringing context of use into practice

Neurodegenerative diseases

eurofins | ADME BIOANALYSES

Supporting DMPK from screening to registration

Share of 2015 Burden of disease (% of Total Disability Adjusted Life Years)



WHO Statement: *« ….unless immediate action is taken globally, the neurological burden is expected to become an even more serious & **unmanageable threat to public health** »*

Neurodegenerative diseases

eurofins | ADME BIOANALYSES

Supporting DMPK from screening to registration

- **NDD affect millions people worldwide in 2021**
- Alzheimer's disease and Parkinson's disease are the most common
- 1/3 of the European population – 179 million persons – is affected by at least one brain disorder
- in 2020, an estimated 5.4 million Americans were living with Alzheimer's disease. An estimated 930,000 people in the United States could be living with Parkinson's disease by 2020.
- NDD occur when nerve cells in the brain or peripheral nervous system lose function over time and ultimately die.
- Although treatments may help relieve some of the physical or mental symptoms associated with neurodegenerative diseases, there is currently no way to slow disease progression and no known cures.

Neurodegenerative diseases

eurofins | ADME BIOANALYSES

Supporting DMPK from screening to registration

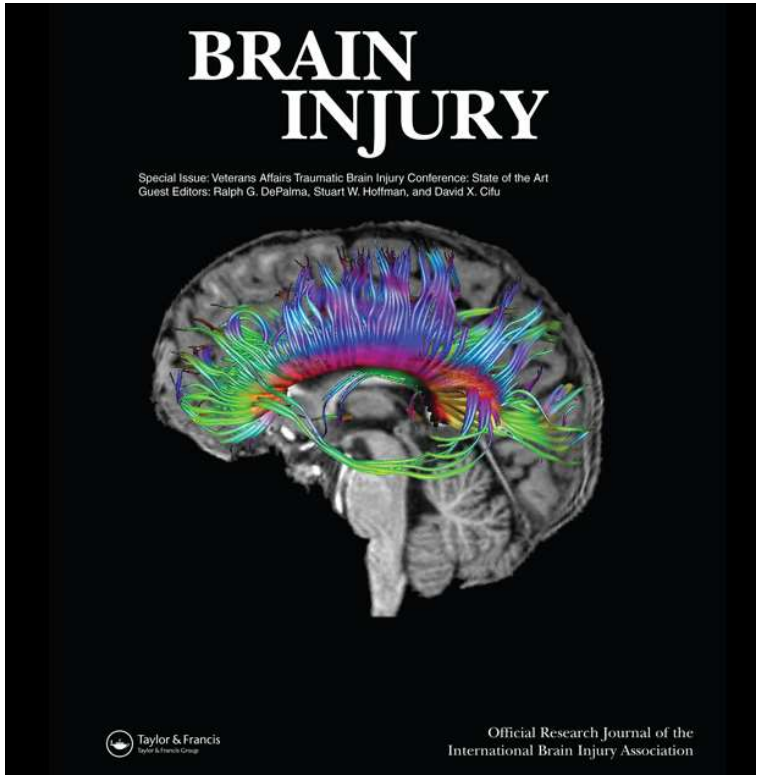
The Human brain is the most complex object of study in the history of science and one of the most inaccessible

- 2% of body weight, but consumes 20% of the oxygen that is used
- composed of about 100 billion nerve cells

- Expertise is scattered, approach to research is fragmented, and resulted datasets are siloed

- Incentives for research and collaboration are lacking and/or misaligned

- Declining federal and industrial support is leading to diminished pipelines



Neurodegenerative diseases

eurofins | ADME BIOANALYSES

Supporting DMPK from screening to registration

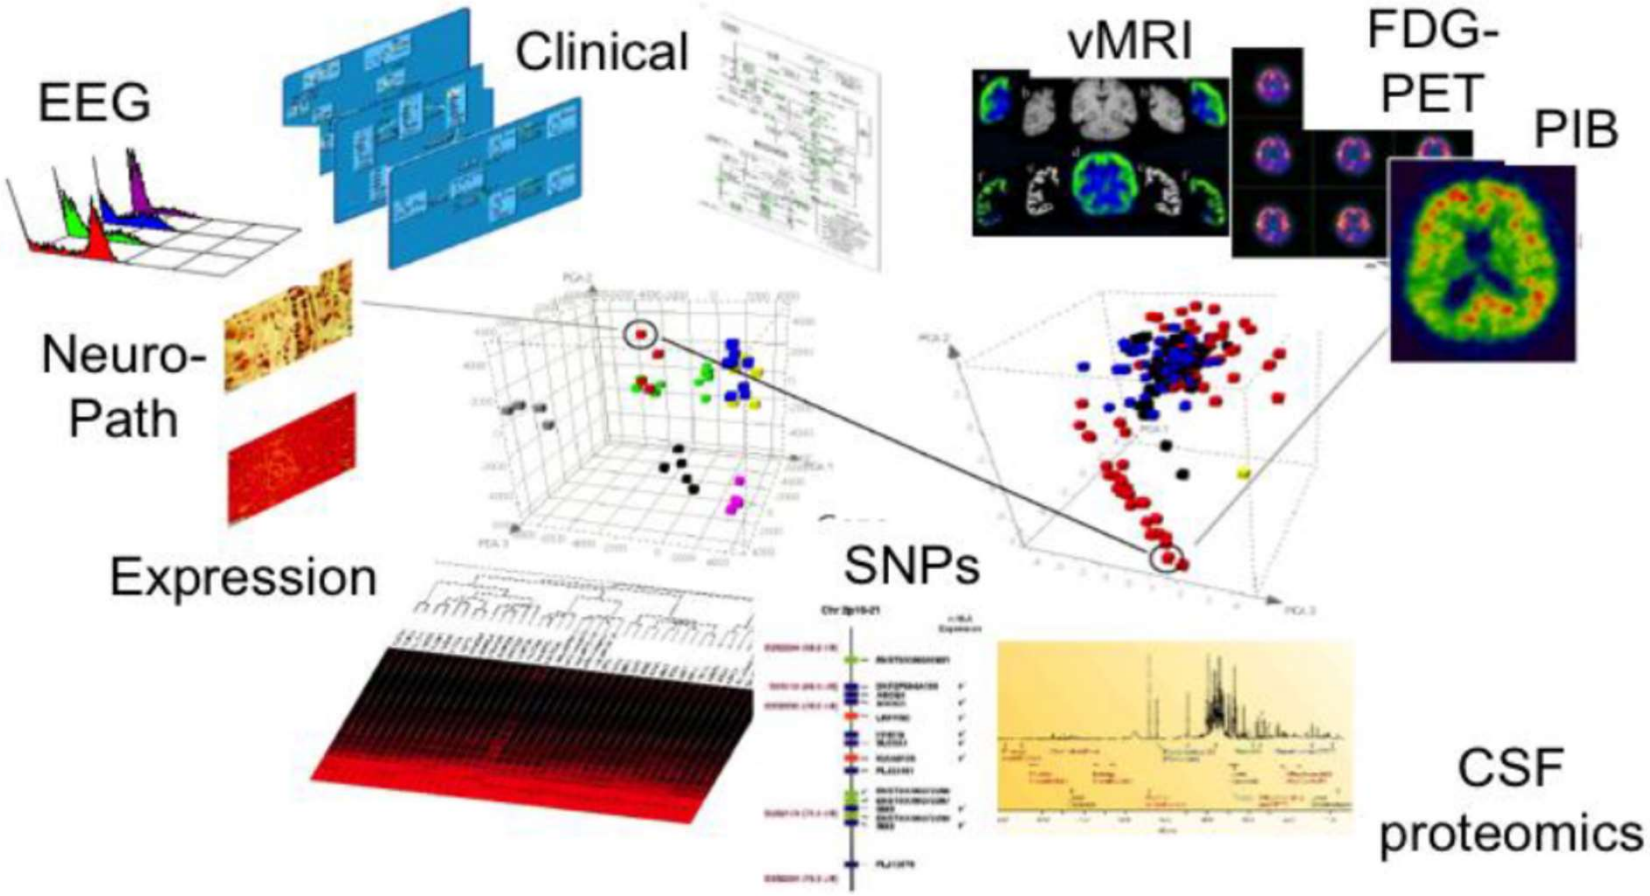
Challenges		Pitfalls
Uncertain target engagement Difficult to detect PD or AD effects in CNS compartment without using reliable analytical methods		Errors in dose selection
‘Noisy readouts’ Cognitive function, mood, psychosis, pain		Need large N to detect small signals
Population heterogeneity Synfromic classification in neurology and psychiatry		Diagnostic uncertainty, Low responder rates
Insidious onset and slow progression Larger and longer trials		Larger and longer trials

Use of Biomarkers in NDD

eurofins | ADME BIOANALYSES

Supporting DMPK from screening to registration

Biomarkers in neurodegenerative diseases are heterogenous, composite and complex

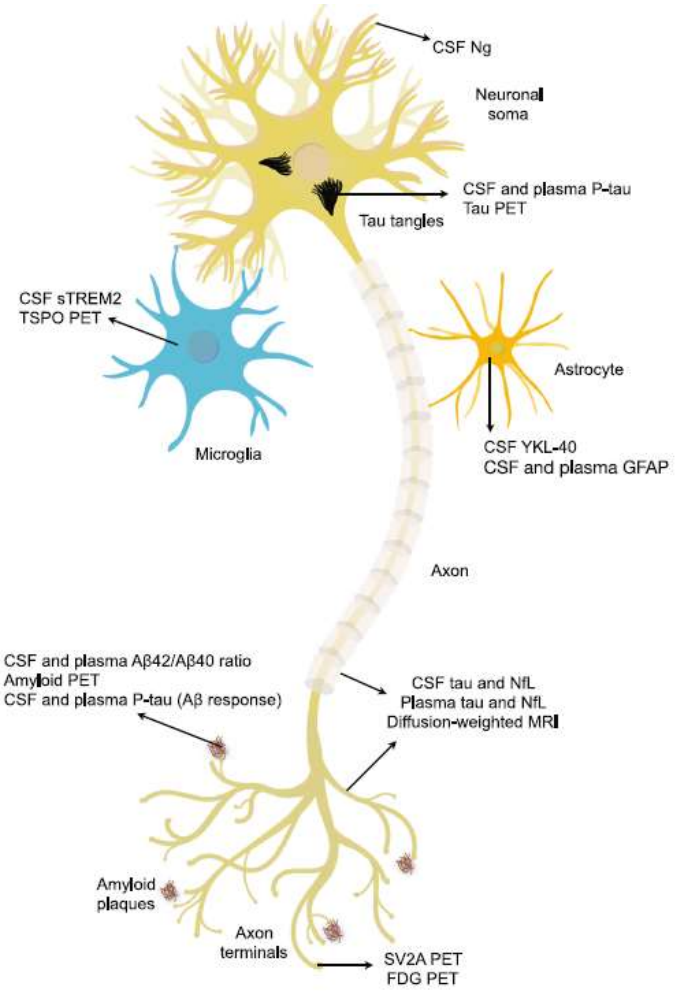


NDD Biomarkers

eurofins | ADME BIOANALYSES

Supporting DMPK from screening to registration

Neurodegenerescence	Biomarker	Matrix
Amyloidopathy	Aß42, Aß40, ratio Aß42/Aß40	CSF
Tau pathophysiology	P-tau181, P-Tau231, P-Tau217 non P-Tau, Tau aggregates	CSF
Neurodegeneration	Total-tau	CSF
Axonal damage	Neurofilament –Light NfL	CSF, serum
Synucleopathy	α-synuclein, β-sheet α-synuclein	CSF
Synaptic dysfunction	Neurogranin	CSF
Microglial responses	sTREM2	CSF
Astrogial-related responses	GFAP, YKL40, S100	CSF, serum
Neuroinflammation	Interleukins multiplex panels	serum
Fronto temporal labor degeneration	TDP43	CSF, serum
Prion	PrPc	CSF



Henrik Zetterberg et al., Molec Psychiatry, 2020

Alzheimer's disease

eurofins | ADME BIOANALYSES

Supporting DMPK from screening to registration

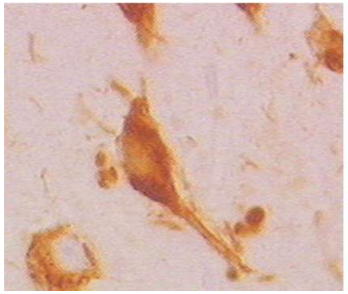
Post-mortem confirmed diagnostic

There are 3 consistent neuropathological hallmarks:

– Amyloid-rich senile plaques
– Neurofibrillary tangles
– Neuronal degeneration

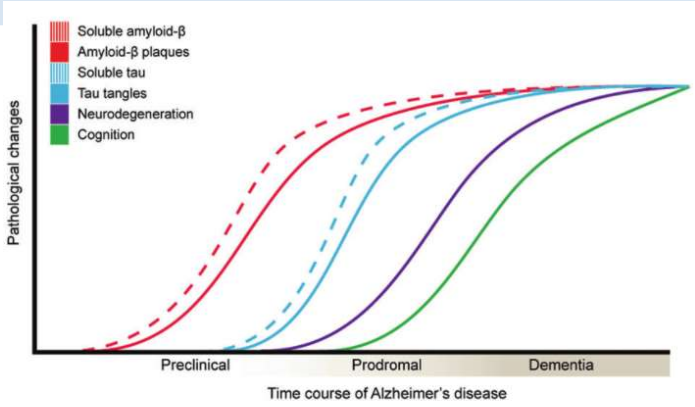
These changes eventually lead to clinical symptoms, but they begin years before the onset of symptoms

Immunocytochemical staining of senile plaques in the isocortex of a brain of a human with AD (anti-amyloid antibody)



Immunocytochemical staining of neurofibrillary tangles in the isocortex of the brain of a human with AD (anti-tau antibody)

The deposition of Ab plaques occurs long before any clinical symptoms and as many as 20 years before the onset of dementia.



Hypothetical time course of pathological changes in Alzheimer's disease (AD), in which biomarkers for amyloid-β become abnormal [cerebrospinal fluid (CSF) amyloid-β 1-42 preceding PET], followed by abnormal tau (CSF p-tau preceding PET), neurodegeneration, and cognitive decline. Adapted with permission from Jack et al. [182] and 2013 [172], Nordberg [238], and McDade and Bateman [235]

NIA-AA Research A-T-(N) Framework

NIA-AA Research Framework: Toward a biological definition of Alzheimer's disease

A: Aβ biomarkers determine whether or not an individual is in the Alzheimer's continuum
Aggregated Aβ or associated pathologic state
CSF Aβ42 or Aβ42/ Aβ40 ratio
Amyloid PET

T: Pathologic tau biomarkers determine if someone who is in the Alzheimer's continuum has Alzheimer's disease.
Aggregated Tau or associated pthologic state
CSF phosphorylated tau
Tau PET

Staging disease severity

(N): Neurodegenerative/neuronal injury biomarkers
Neurodegeneration or neuronal injury
CSF total Tau
Anatomic MRI and/or FDG PET

(C): Cognitive symptoms

AT(N) profiles	Biomarker category	
A-T-(N)-	Normal AD biomarkers	
A+T-(N)-	Alzheimer's pathologic change	Alzheimer's continuum
A+T+(N)-	Alzheimer's disease	
A+T+(N)+	Alzheimer's disease	
A+T-(N)+	Alzheimer's and concomitant suspected non Alzheimer's pathologic change	
A-T+(N)-	Non-AD pathologic change	
A-T-(N)+	Non-AD pathologic change	
A-T+(N)+	Non-AD pathologic change

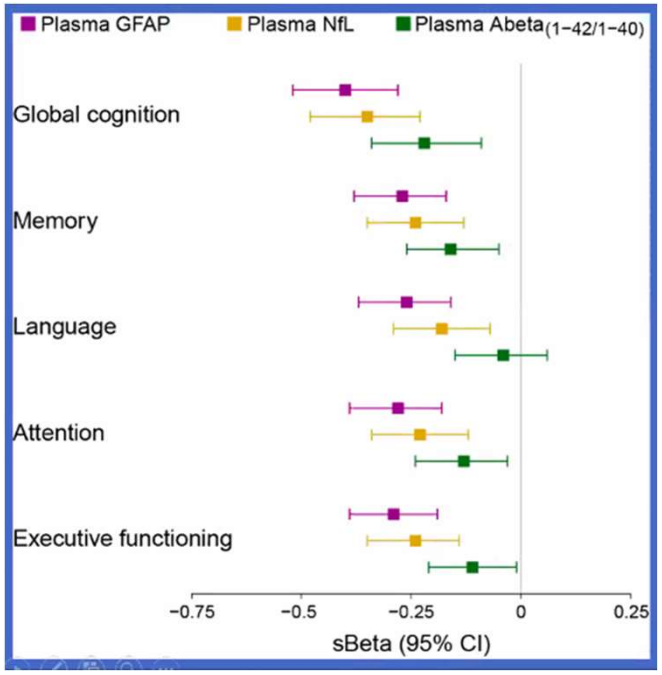
Serum GFAP associated with cognitive decline

eurofins | ADME BIOANALYSES

Supporting DMPK from screening to registration

Serum markers glial fibrillary acidic protein and neurofilament light for prognosis and monitoring in cognitively normal older people: a prospective memory clinic-based cohort study



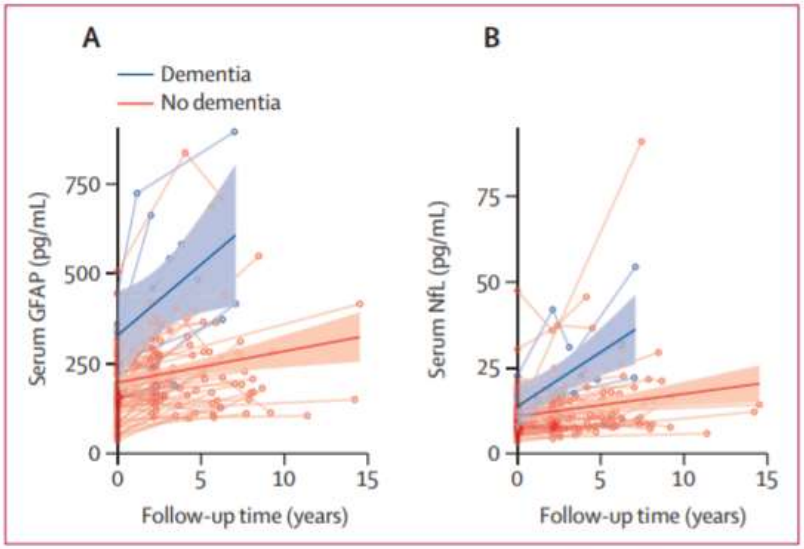


Figure 2: **Spaghetti plots of longitudinal serum GFAP (A) or NfL (B) levels for individuals with and without progression to dementia over time**
Serum GFAP (A) and NfL (A) levels were plotted against time, colour coded for progression to dementia over time or no progression to dementia over time. We superimposed average slopes per group, with 95% CIs. GFAP=glial fibrillary acidic protein. NfL=neurofilament light.

Inge M W Verberk et al., The Lancet, 2021

Alzheimer's disease

06/07/2021: **Aduhelm (aducanumab)** is the first novel therapy approved for Alzheimer's disease since 2003.

The screening of libraries of human memory B cells for reactivity against aggregated Aβ led to the molecular cloning, sequencing, and recombinant expression of aducanumab (BIIB037), a **human anti-Aβ monoclonal antibody** that selectively targets **aggregated forms of Aβ**, including **soluble oligomers** and **insoluble fibrils**.

Discovery

Pre-clinical studies

Clinical studies

- Sample collection and storage procedures according to KOLs & literature guidelines (sample volume, DBS, -80°C)
- Samples tracking with Watson LIMS system
- Short turn around time for sample analysis & results sending

➢ Clinical Data Interchange Standards data (CDISC)

➢ FDA compliant study reports and/or customers' template

Take-Home message

eurofins | ADME BIOANALYSES

Supporting DMPK from screening to registration

- Biomarkers improve assesment of disease and drug effects: target engagement, pharmacodynamics (PK/PD), efficacy, disease progression;
- The effective use of biomarkers can increase the probability of succes
- Biomarker qualification (FDA) takes years including clinical and analytical BMK validations
- In drug development, validation of PK assays are not validation of BMK assays ‘Fit for purpose approaches’
- The second and third waves of AD BMKs used in combination in blood and or/CSF will help to sucess Pharma and Diag studies

Thank you
