

GTB LAB demonstrates

- Circular building design
- Construction without value degradation of materials
- Circular building methods
- Use of digital tools/ BIM for management of circular material streams
- Standardisation of Circularity profiles

Architect: E.Durmisevic, 4D Architects
Constructeur: J.van Heijster, AB
Installatie: J.Widenhof, ABT
Aanmeer : Jongen Bouw
Leveranties: De Groot Vroomshoop, Jansen/ODS, Pilkinton, TNM, Rodeca, Ammanu

Dr. Elma Durmisevic, Founder GTB Lab

Buildings frequently undergo Demolition due to :

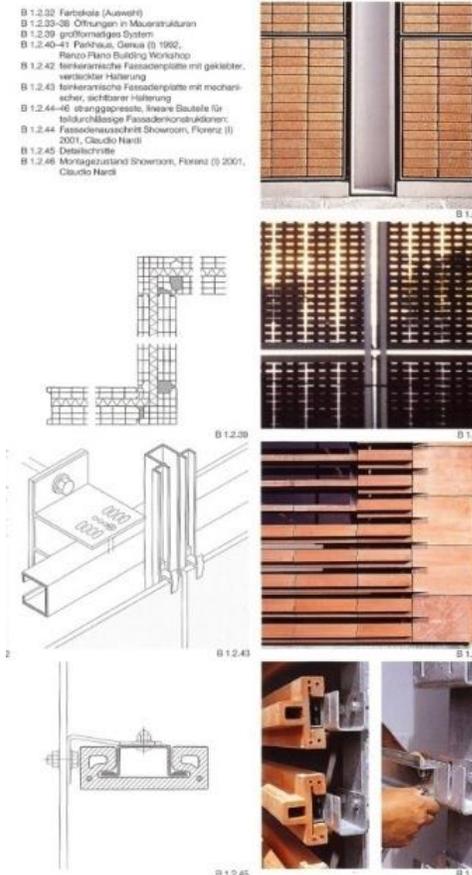

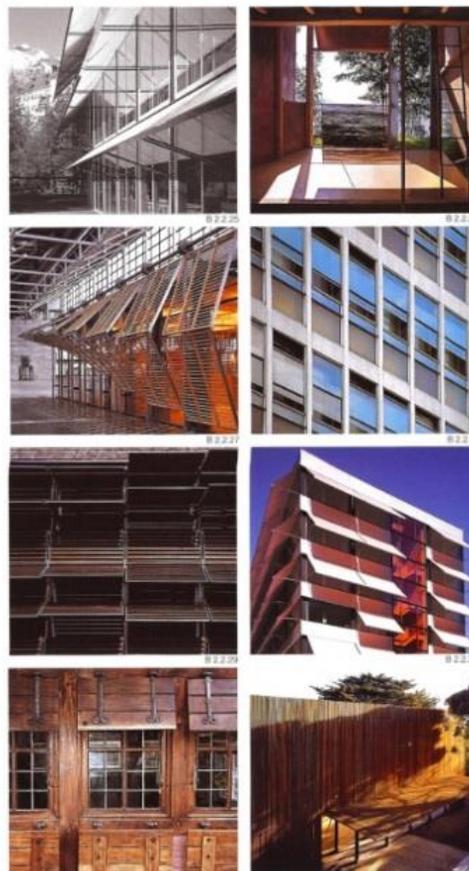

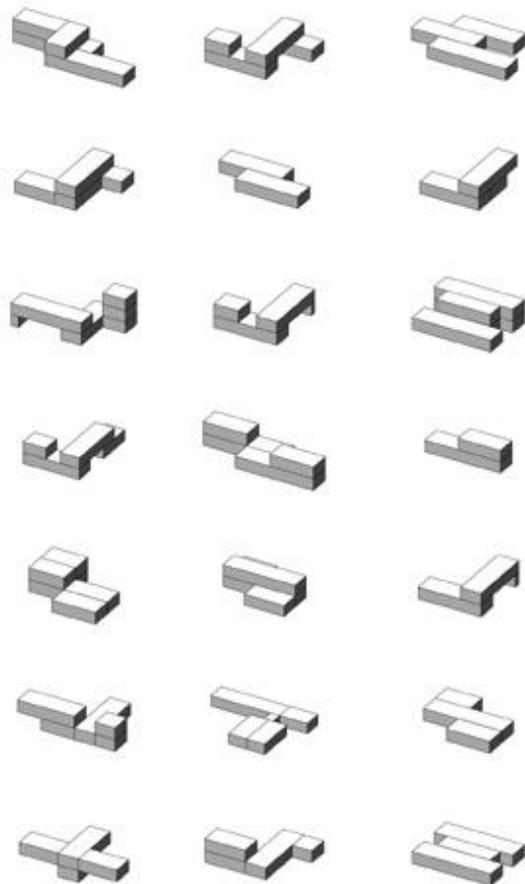

- degradation of materials and more technology dependent components
- Inability to remove and exchange building systems and components
- unfitted for recycling
- difficult to repair
- difficult to access
- difficult to deconstruct

- 40% CO2 emission in world is building related
- 50% of material resources taken from the nature are building related
- over 39% of national waste production comes from the building sector

Future Generation of Buildings REVERSIBLE BUILDINGS

Paradigm Shift towards Circular Buildings and Economy

Multiple layers of buildings enable multiple value propositions by reversible design ©E.Durmisevic 2016

Reversible Building Design Dimensions

Towards reversible BIM ©Model Durmisevic 2015

THREE DESIGN DIMENSIONS OF REVERSIBLE BUILDINGS

Elma Durmisevic,

Ensure multiple value propositions of Building through three dimensions of building's reversibility

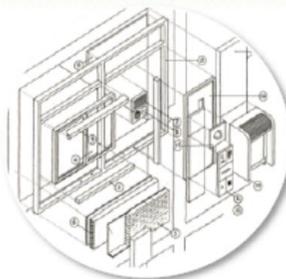

1

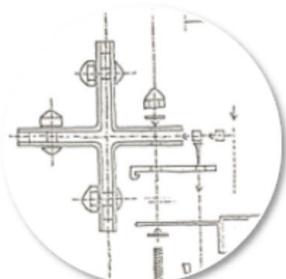

Reversibility of space
Adapt space

2

Reversibility of structure/
Reconfigure /upgrade structure

3

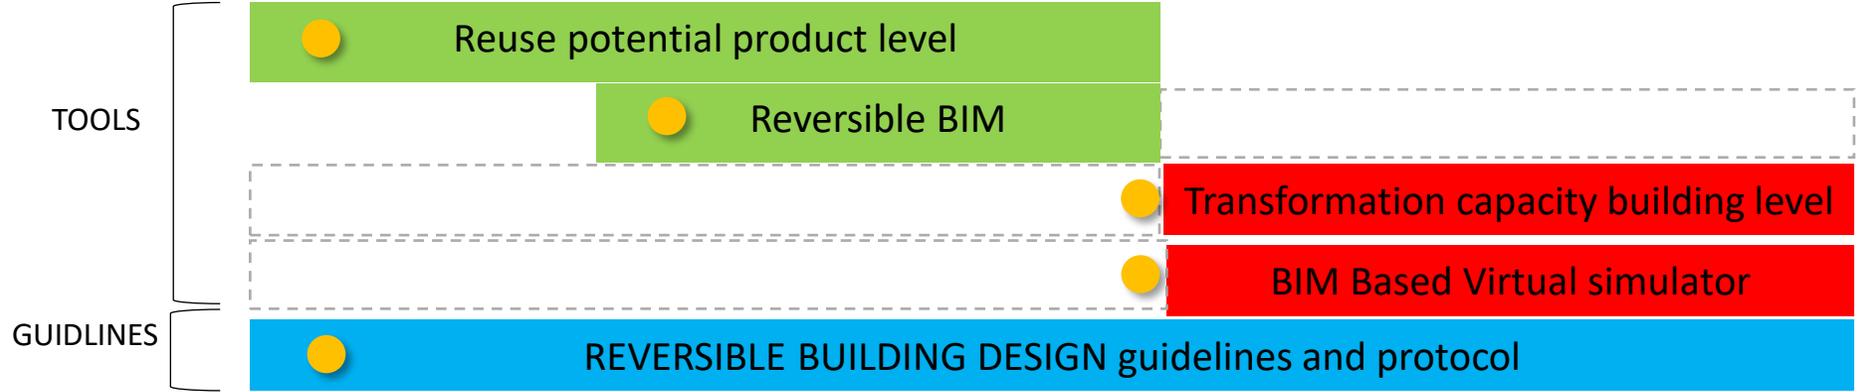

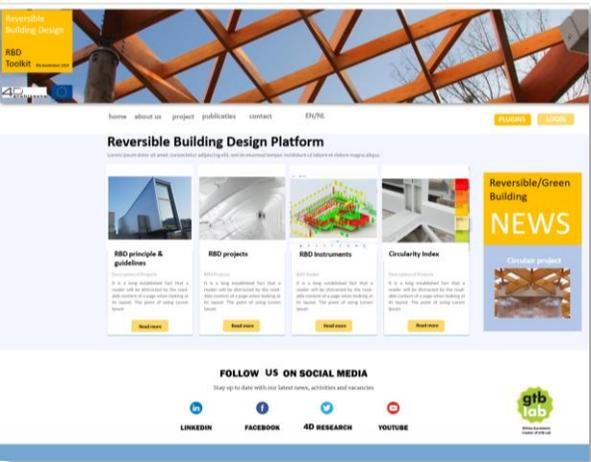

Reversibility of material/
Separate elements/ material

Dr. Elma Durmisevic, BAMB program/research leader of Reversible Building Design group, 4D architects founder GTB lab & GDC SGDF

3 CATEGORIES OF MATERIAL STREAMS

in relation to the RP score

- IRREVERSIBLE**
if RP indicates that a system has **RP < than 0,3** these systems will be characterised as irreversible and **the end of life options = RECYCLING/DOWN CYCLING.**
- PARTLY REVERSIBLE**
If system has **RP > 0,3 and RP < 0,6** end of life options = **REMANUFACTURE/ MAJOR REPAIR,**
- REVERSIBLE**
If system has **RP > 0,6** this would mean that besides **DIRECT REUSE AND MINOR REPAIR** of its parts the system can be **RECONFIGURED AND UPGRADED** and its **dimensions adjustable to fit new requirement.**

BUILDING REUSE POTENTIAL

- Connect elements
- Reversible connections
 - Gravity connection
 - A1 (Gravitational force connection)
 - Intermediary connection
 - A2 (Indirect Force connection with fastener)
 - Direct connection between two pre-made components
 - B1 (Direct Form-lock connection)
 - Direct connections with connecting device
 - Indirect connection via dependent third component
 - B2 (Form-lock connection with fastener)
 - Direct connection with additional fixing device
 - C1 (Direct two access connection (bolt-nut))
 - C2 (One access threaded connection (screw))
 - C3 (One access non-threaded connection (nail, fixation part))
 - Hidden indirect connector
 - Direct insert connection
 - C4 (Hidden dowel connection (dowel connection))
 - C5 (Irreversible one access (rivet))
 - Direct chemical connection
 - Indirect connection with reversible chemical connection
 - D1 (Material weaker than connected part (glue, tape))
 - D2 (Covering material, weaker than connected part (paint, plaster, screed))
 - Indirect connection with irreversible chemical connection
 - D3 (Material stronger than connected part (cement))
 - Direct chemical connection
 - D4 (Covering material, stronger than connected part (in-situ concrete))

Summary of selected markers

Circularity Meter

Circularity meter will assess reuse potential and circularity of materials within a building indicating the potential material flows related to the circularity score. It monitors city building material flows and enables to identify the gap between the linear and circular economy in built environment, per region/city.
